Brooklyn, NY

Summary

Engineer experienced in designing and automating reliable infrastructure systems. Skilled in automating data workflows and infrastructure processes, designing efficient and robust software, and improving system performance, reliability, and capability. Up-to-Date software engineering skills including AI / Machine Learning. Focused on creating maintainable, well-designed solutions that enhance team productivity and real user experience. Motivated by solving complex problems and delivering real impact on critical software environments.

Skills

Software: Python, HCL, Golang, Java, Object-oriented programming, Git, Agent AI, JavaScript

Platforms: AWS, Linux Systems Administration, Windows, Serverless Architecture (AWS Lambda), Networking & Security (VPC, ELB, IAM)

Tools: Terraform, Git, Agent AI, Docker, CI/CD (GitLab Pipelines, GitHub Actions), DataDog

Experience

Junior DevOps Engineer, Togetherwork – Remote

Aug 2022 – Oct 2025

- Architected and developed scalable infrastructure systems using reusable Terraform modules, standardizing cloud deployments while driving cost reduction, performance optimization, and improved reliability across AWS environments.
- Developed a Terraform module alone to automate data masking by orchestrating AWS Step Functions with multiple Python Lambda functions, enabling secure replication and sanitization of production databases for lower environments. Leveraged AI to greatly increase development speed.
- Automated security and compliance workflows by integrating AWS Patch Manager via SSM with Terraform, ensuring consistent patch deployment and reducing operational overhead.
- Designed and deployed a standardized monitoring system for Stripe transaction activity to detect and prevent fraud and carding attacks, implemented through a Terraform module to ensure consistent coverage across multiple organizations.

DevOps Intern, Togetherwork– Remote

Feb 2022 – Aug 2022

- Developed and standardized observability practices across multiple organizations by configuring Datadog metrics, logs, and APM dashboards, improving system visibility and reducing incident response time.
- Implemented infrastructure automation using SaltStack (SaltState) to deploy and configure services consistently across environments, enhancing scalability and reducing manual setup time.
- Defined monitoring and alerting standards for different organizational units, ensuring uniform performance tracking and operational reliability across distributed systems.

Projects

Car Cost Calculator and Recommender

perfectcarpicker.jonahrosenberg.work | github.com/jorosenberg/perfect-car-picker

- Vehicle recommendation engine using Scikit-learn (NearestNeighbors) and AWS Bedrock (Generative AI) to provide car recommendations and personalized sales pitches. Hyper-accurate True Cost of Ownership (TCO) financial modeling.
- Terraform designed system, deploying a containerized Streamlit frontend on EC2 and a serverless Python backend on AWS Lambda via ECR, integrated with an Amazon RDS (PostgreSQL) database and automated GitHub Actions CI/CD pipelines.

Job Scraper and AI Analyzer

joblink.jonahrosenberg.work / github.com/jorosenberg/joblink

- Job scraping platform using a serverless microservices architecture (AWS Lambda, API Gateway) to automate data extraction from various job boards, utilizing Docker and Terraform for Infrastructure-as-Code (IaC) and automated CI/CD.
- Integrated AI-powered semantic matching implementation with a Sentence-BERT (NLP) pipeline to generate 384-dimensional vector embeddings, enabling high-accuracy similarity analysis and relationship visualization via PostgreSQL with the pgvector extension for multiple companies, allowing comparison of model predictions against historical data.

Education

Rochester Institute of Technology – Software Engineering

Aug 2020 - Dec 2021
